

Tanger

Climate Change Statement

Tanger recognizes climate change is a real phenomenon that threatens the viability of economic and environmental systems globally. Climate change has been studied, evidence collected, and analysis performed for decades by the scientific community.

A consensus exists among scientists that climate change is occurring outside of the boundaries of historical planetary warming trends, and that human sources of carbon emissions are a significant contributor to the warming phenomenon. As a real estate owner, Tanger strives to limit its climate impact by measuring and managing direct and indirect greenhouse gas emissions sources and assessing risks and opportunities in areas such as regulation, physical operations, business disruptions, insurance claims and liabilities, and corporate reputation.

Tanger is committed to minimalizing climate change risks associated with managing our properties. Our response includes taking preventative measures to reduce greenhouse gas (GHG) emissions, aggressive mitigation efforts to minimize the direct and indirect consequences of climate change, and utilizing adaptive strategies to address climate change impacts that cannot be determined or avoided.
